Click Network Settings (Shown Above)

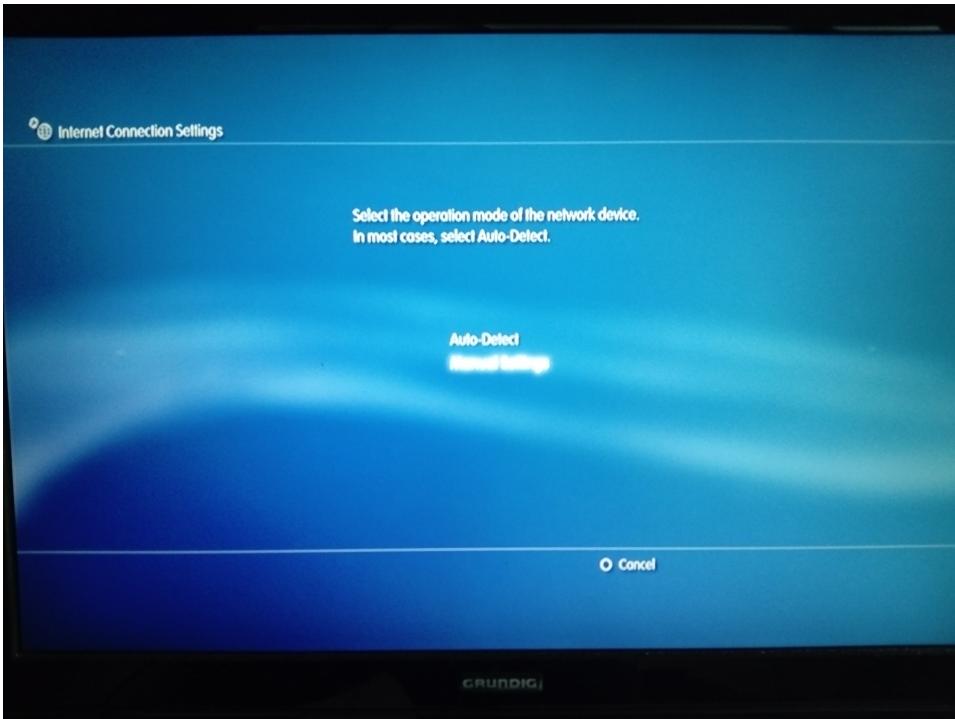

Click Internet Connection Settings (Shown Above)

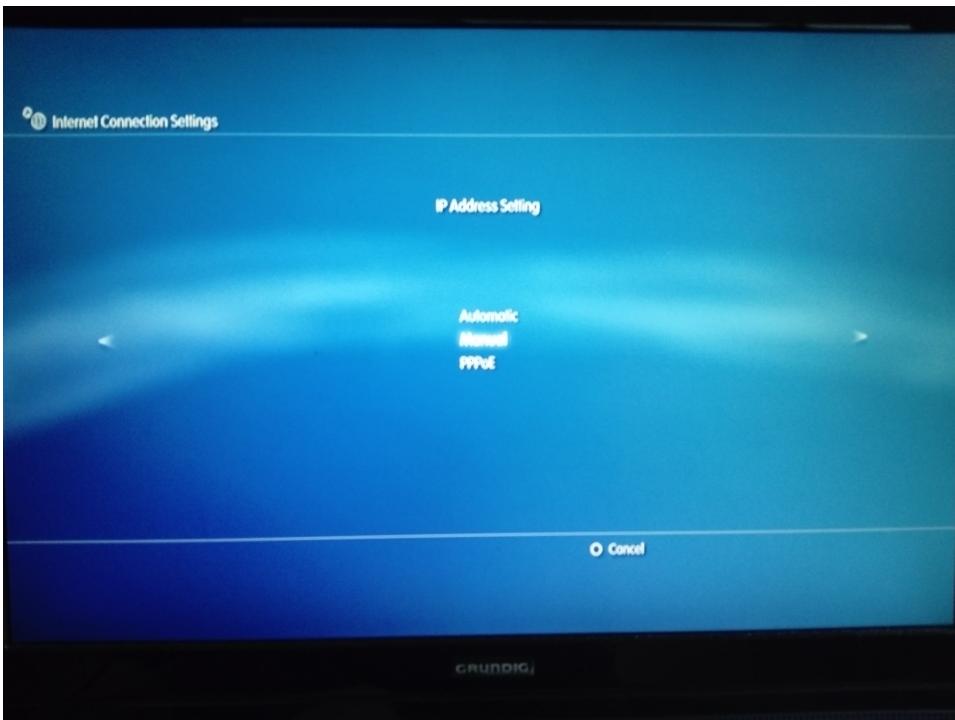

Click Easy (Shown Above)

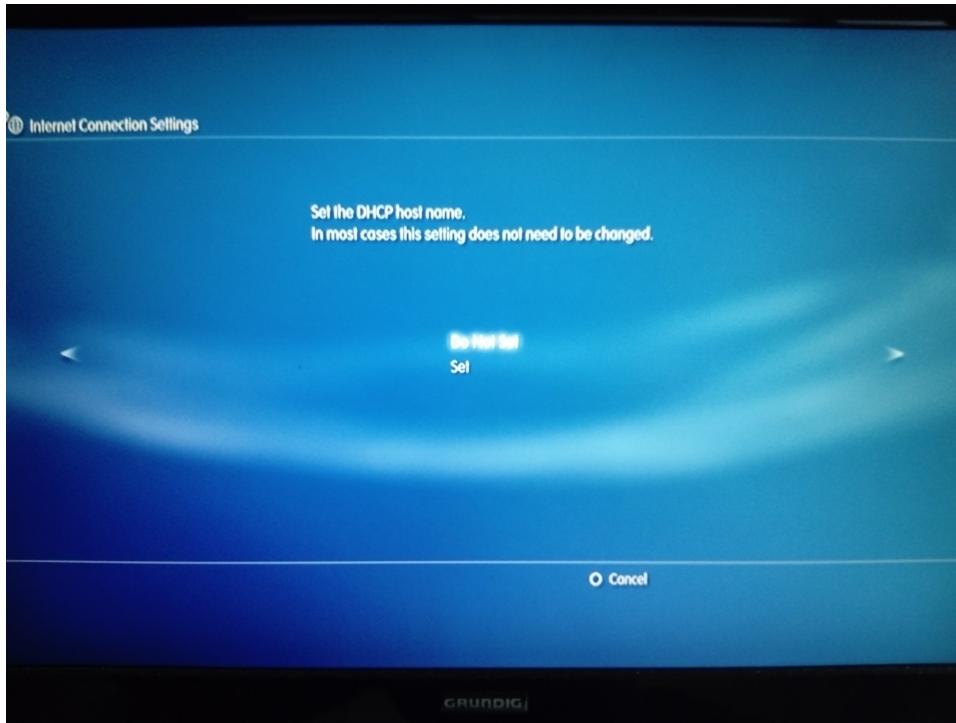

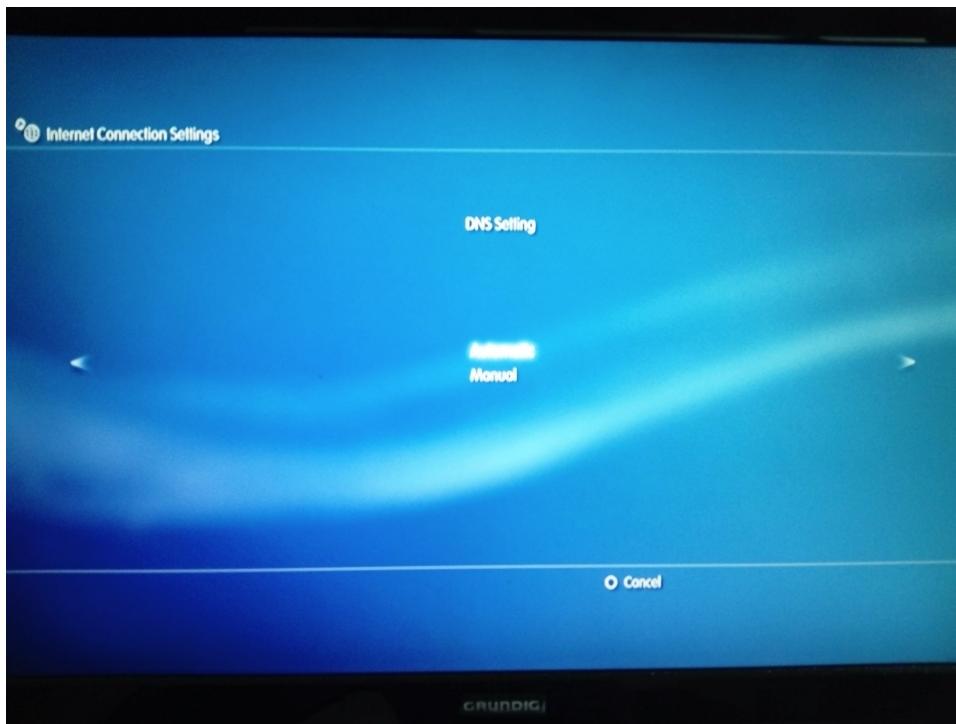

In this window, I usually just select Auto-Detect

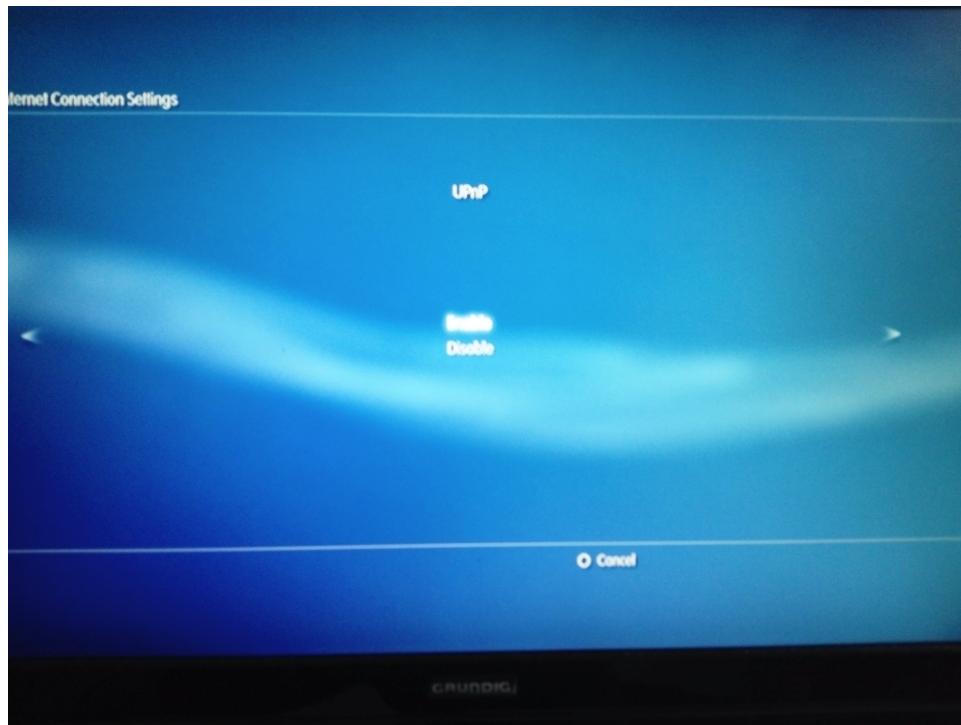

On the screen shown above, automatic is usually fine.

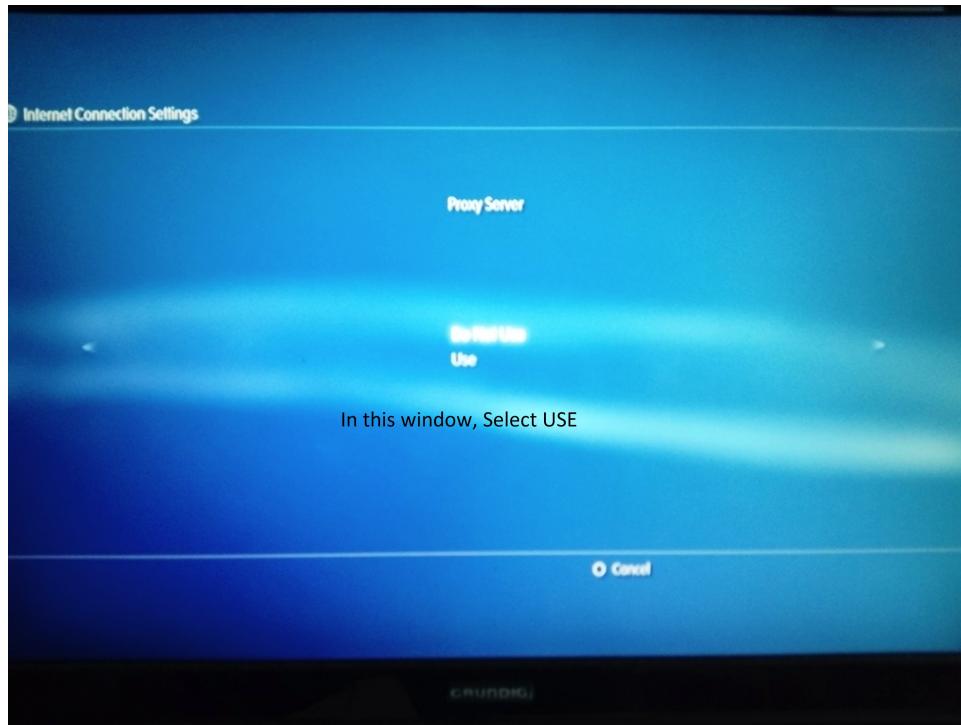

On here, I normally click Do Not Set

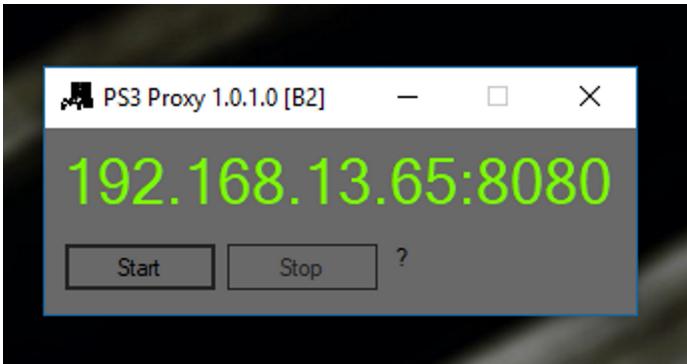

On the screen above, DNS is normally fine on automatic

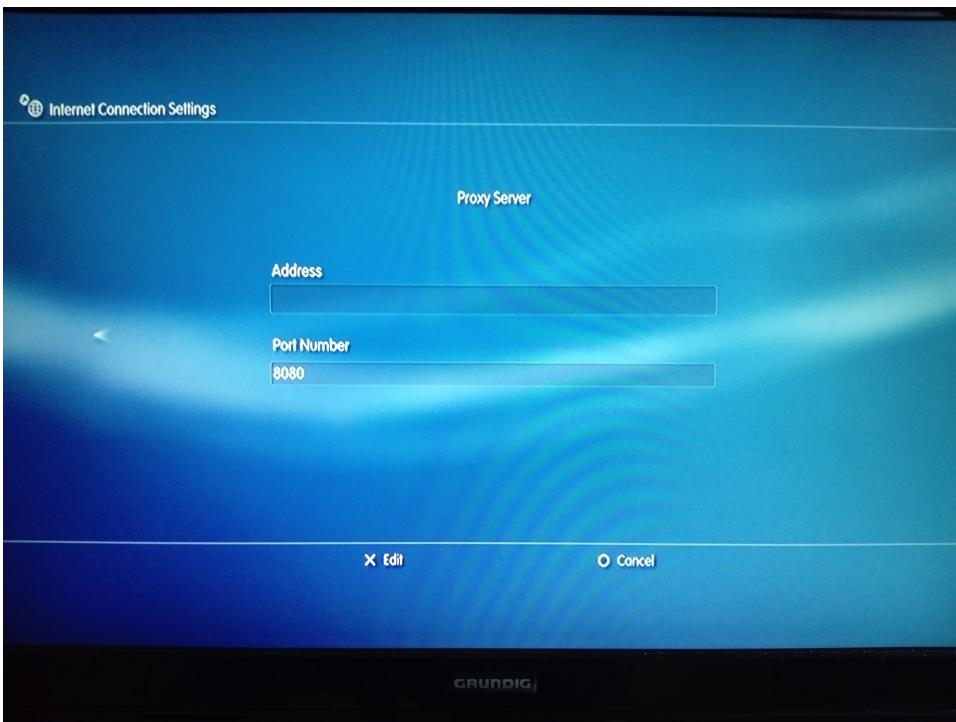

UPNP is normally fine on enable

In this window, Select USE

Run this application on your computer. Take note of what it displays.  
On the screen above, we see the IP address (192.168.13.65) and port (8080)  
Click Start to run the proxy.

Enter the details from the application here. In our example here, we would enter 192.168.13.65 into the address field, and leave 8080 in the port number.

You should now be able to get online with your 4.82 or above system.  
Currently only CEX has been tested.
